
Density-optimal smoothing erases a weak mode into its noise floor
predicted $\sqrt{T_{\rm eff}^2} = 0.29$,
measured $= 0.291$
erasure: slope $= 1.0000$, $R^2 = 1.0000$
measured ratio
analytic ratio
floor rate $= 0.222$
CENSORED: mode reaches its floor inside the fit window;
slope is an erasure-collision artifact, not a physical rate
$\ln|\widehat{E}_x(m=1,t)|$
time, $\omega_p t$
common fit window
seed traces ($\alpha = 0.15$)
CIC mean
MISE-optimal mean
CIC fit: $\gamma = -0.080$
MISE fit: $\gamma = -0.211$
late floors
