(a) Coherent mode erasure and floor collision
CIC
reference-MISE width
predicted sqrt(T_eff^2) = 0.29
measured 0.291
$\gamma_{\mathrm{CIC}} = -0.0796$
$\sqrt{a_1}$ sqrt
late_floor_ratio = 0.2221569
$\gamma_{\mathrm{MISE}} = -0.211$
CENSORED: mode meets its floor inside the window; slope is an erasure-collision artefact, not a physical rate
$\log_{10}|\hat{E}_x(m=1,t)|$
Time, $t\omega_{\mathrm{pe}}$
(b) Erasure across bandwidths
slope = 1.0008, $R^2 = 1.0000$
y=x
erasure predicted and measured across bandwidths, zero fitted parameters
Measured initial-amplitude ratio
Predicted $\sqrt{T_{\mathrm{eff}}^2}$
